

SECMS – Speaker Notes (Slide by Slide)

Slide 1: Title Slide

“Good morning everyone. Our project title is **Student Enrollment & Course Management System (SECMS)**. This is a Salesforce-based application developed to automate and simplify academic enrollment activities such as student registration, course management, instructor assignment, approvals, fee tracking, and reporting.”

Slide 2: User Story

“SECMS provides a centralized platform where administrators, enrollment officers, and instructors can manage academic information efficiently. The system reduces manual work and improves data accuracy using Salesforce automation features.”

Slide 3: Introduction – Project Overview

“In many institutions, enrollment information is maintained manually using spreadsheets and documents. This causes duplication and delays. SECMS solves this problem by storing all information in one Salesforce application.”

Slide 4: Purpose of SECMS

“The main purpose of SECMS is to centralize student and course information, automate workflows, improve reporting, and provide secure access to academic data.”

Slide 5: Problem Statement

“Enrollment officers face challenges because data is scattered across multiple files. Administrators also find it difficult to track enrollments and revenue. SECMS provides a centralized solution.”

Slide 6: Empathy Map

“The enrollment officer wants faster processing and fewer errors. Current manual systems create delays. SECMS reduces these problems through automation and dashboards.”

Slide 7: Brainstorming & Idea Selection

"We considered spreadsheet systems, web portals, and database applications. Salesforce-based SECMS was selected because it offers cloud storage, security, automation, and reporting features."

Slide 8: Customer Journey

"The process starts with student registration, followed by course selection, enrollment request, fee verification, approval, instructor assignment, and finally reporting."

Slide 9: Functional Requirements

"The main functions include student management, course management, instructor management, enrollment processing, approvals, automation, reporting, and security."

Slide 10: Non-Functional Requirements

"The system should be user-friendly, secure, reliable, fast, scalable, and continuously available through cloud technology."

Slide 11: Data Flow & Technology Stack

"User information is entered into Salesforce objects, validated, processed through automation, and displayed in reports and dashboards. We used Salesforce Lightning, Flows, Validation Rules, Approval Processes, Reports, and Dashboards."

Slide 12: Problem-Solution Fit

"SECMS solves common academic problems such as fragmented records, manual processing, slow approvals, and difficult reporting using Salesforce automation."

Slide 13: Solution Architecture

"The architecture contains user, application, data, automation, reporting, and security layers. These layers work together to provide a complete enrollment management system."

Slide 14: Project Planning

"We followed the Agile methodology. The project was divided into multiple sprints, and tasks were completed step by step."

Slide 15: Sprint Plan

"The project includes six sprints covering developer setup, object creation, automation, security, reports, and dashboards."

Slide 16: Project Development Milestones

"The development process included creating Salesforce objects, fields, relationships, flows, approval processes, reports, dashboards, and security settings."

Slide 17: Salesforce Objects

"We created four custom objects: Student, Course, Instructor, and Enrollment. These objects store all project data."

Slide 18: Student & Course Fields

"The Student object stores personal details, while the Course object stores course information such as category, duration, and fees."

Slide 19: Instructor & Enrollment Fields

"The Instructor object stores faculty details, and the Enrollment object connects students, courses, and instructors."

Slide 20: Relationships & Record Types

"Lookup relationships connect Enrollment with Student, Course, and Instructor. Record types support different enrollment processes."

Slide 21: Validation Rules

"We implemented validation rules to ensure data accuracy. For example, institutional email validation and payment verification before approval."

Slide 22: Approval Process

"Enrollment requests are sent to an authorized approver. Based on the decision, the status changes to Approved or Rejected."

Slide 23: Flow Automation

"Flows automate repetitive tasks such as setting enrollment dates, assigning instructors, creating tasks, and sending notifications."

Slide 24: Reports

"We created reports such as Student Status, Course Enrollment, Pending Requests, and Fee Collection reports."

Slide 25: Dashboard

"The dashboard provides visual information using charts and tables to help management monitor academic activities."

Slide 26: Security Setup

"Profiles, Permission Sets, and Sharing Settings are used to control access and protect academic data."

Slide 27: Functional & Performance Testing

"We tested all modules including objects, validations, flows, approvals, reports, and dashboards to ensure correct functionality."

Slide 28: Advantages & Disadvantages

"The advantages include centralized data, automation, reporting, and security. The main limitation is dependence on the Salesforce platform."

Slide 29: Conclusion

"SECMS successfully transforms manual enrollment activities into an automated Salesforce-based solution that improves efficiency, accuracy, and decision-making."

Slide 30: Future Scope

"In the future, the system can include payment gateways, student portals, mobile applications, attendance, examinations, and advanced analytics."

Slide 31: Thank You

"Thank you for giving us this opportunity to present our project. We are happy to answer any questions."
